

## Bigger, Faster...But I'm Smarter Fill in the Blank

people understand important hospital computer damage acting body head consciousness protective concussion accidents swelling environment helmet body thinas Concussions places brain

Concussions occur when your <u>brain</u> gets injured. Your brain is the <u>computer</u> for your body and controls all the different organs and its parts. It helps you to <u>understand</u> what is happening inside and gives your <u>body</u> information about what is happening in your <u>environment</u>. This information helps you adjust and keep your <u>body</u> safe. Your brain also controls how you feel about <u>people</u>, <u>places</u> and <u>things</u> that are in your life.

When a <u>concussion</u> occurs, your brain temporarily loses its abilities, like a power outage. This could be a loss of <u>consciousness</u> (fainting) or people around you may notice changes in the way you are <u>acting</u>. A concussion is caused when a person's head is hit by an object, they fall and hit their <u>head</u>, or their head is shaken with force. Children are more prone to concussions. If you have experienced any <u>accidents</u> or impact to your head seek immediate medical attention. It is <u>important</u> to get checked out even if you do not feel any immediate symptoms. They do not always show up right after the injury.

The doctor may suggest you take some tests at a <a href="https://www.nost.org">hospital</a>. Most of the time you will be asked to take a break and guard against repeat concussions. Your brain needs to rest so that any <a href="https://www.nost.org">swelling</a> inside your head can go down and any fluid that has been shaken can settle back into place. Repeat concussions lead to additional damage to your brain that may not heal.

To prevent concussions, wear <u>protective</u> equipment such as a <u>helmet</u>. Drive and ride intelligently by using seat belts and obeying the speed limits. Your brain is precious. Take care of it!
